the 1990s, the number of people in the world who are undernourished has increased from 600 million to 800 million (FAO 1996).

There are a number of reasons for this increase. First, the world population has increased from 5 billion in 1987 to 6 billion in 1997, and is projected to reach 8 billion by 2025 (UNEP 1997). Second, the world population is becoming increasingly urbanized, and this has led to a greater demand for food. Third, the world population is becoming increasingly aged, and this has led to a greater demand for food. Fourth, the world population is becoming increasingly mobile, and this has led to a greater demand for food.

There are a number of ways in which the world can meet the growing demand for food. One way is to increase the production of food. This can be done by increasing the area of land used for agriculture, by increasing the yield of crops, or by increasing the number of crops grown per year. Another way is to reduce the waste of food. This can be done by reducing the amount of food that is lost during production, by reducing the amount of food that is lost during distribution, or by reducing the amount of food that is lost during consumption.

There are a number of ways in which the world can reduce the waste of food. One way is to reduce the amount of food that is lost during production. This can be done by using more efficient farming techniques, by using more efficient irrigation systems, or by using more efficient harvesting techniques. Another way is to reduce the amount of food that is lost during distribution. This can be done by using more efficient transportation systems, or by using more efficient storage systems.

There are a number of ways in which the world can reduce the amount of food that is lost during consumption. One way is to reduce the amount of food that is wasted at home. This can be done by using more efficient cooking techniques, by using more efficient storage techniques, or by using more efficient eating techniques. Another way is to reduce the amount of food that is wasted in restaurants. This can be done by using more efficient cooking techniques, by using more efficient storage techniques, or by using more efficient eating techniques.

There are a number of ways in which the world can increase the production of food. One way is to increase the area of land used for agriculture. This can be done by converting more land from forest to agriculture, or by converting more land from pasture to agriculture. Another way is to increase the yield of crops. This can be done by using more efficient farming techniques, or by using more efficient irrigation systems.

This can be done by using more efficient shipping techniques, or by using more efficient trucking techniques. Another way is to use more efficient storage systems. This can be done by using more efficient storage techniques, or by using more efficient transportation systems.
